

20k is probably a good approximate value, select so 10V pp produces output

Probably want gain -2

on/off Homemade 44R / 1.1k too small Xive 1.6k / 1.5M use

Component values in this section for max 20 mA through LED with 0-10V CV (with negative CV suppressed). Best operation for 0-5V, higher CV doesn't do much.

Shown as voltage divider but so far connected as variable resistor, try both
